

North Campus sorting pilot: why it matters

Why it matters

Sorting errors make it harder to keep reusable materials separate on a campus.

Camera-assisted workflow

Workflow

The workflow scans items with a camera and sends uncertain cases to staff review, so it does not decide every item automatically.

Pilot observation

42%

→

29%

Observed change

In the synthetic four-week case, the observed incorrect-sorting share changed from 42% to 29% across 1,000 inspected items per week (p. 1).

Operating trade-offs

18

minutes per day

Staff review

Staff review: 18 minutes per day

two

hours per week

Camera maintenance

Camera maintenance: two hours per week

Conclusion

Takeaway

The results are promising,
not proven.

Limits

Because this synthetic pilot has no randomized control group, the study design cannot establish causation. The safest reading is that the workflow may be useful, but the observed change should be treated as a pilot signal, not proof.
